Preface

This Quick Start Guide contains step-by-step instructions on installing Parallels Desktop and creating a ready-to-use virtual machine with Windows XP or Windows Vista operating system installed.

This guide also provides instructions on stopping, starting, and pausing the virtual machine, switching between viewing modes, installing applications, and other helpful information.

In This Chapter

Glossary of Terms.....	4
Virtual Machine Hardware.....	5

Glossary of Terms

Primary Operating System (Primary OS): The operating system that is loaded when you turn on your Macintosh computer. In this case, it's Mac OS X.

Virtual Machine (VM): Parallels Desktop emulates a computer running inside your Mac. This emulated computer is called a virtual machine. A virtual machine has its own hardware (generic sort), and its own "screen" (rather large window), and requires an operating system. Operating system and its applications are isolated within the virtual machine and share the Mac's physical hardware.

Using virtual machines enables you to:

- Simultaneously run multiple operating systems (OSes) and their applications on a Mac.
- Switch between operating systems, without restarting your Mac.
- Have all the software you need on one physical machine.

Guest Operating System (Guest OS): It is another operating system on your Mac. The guest OS can be Windows XP, Windows Vista, Linux, or any other supported operating system that resides in your virtual machine.

Virtual Machine Configuration: The list of the virtual machine's options and devices. This list is displayed on Configuration Page and is available for editing in Configuration Editor.

ISO Image: A file that contains the entire contents of a CD or DVD disc, commonly used to install a guest operating system in a virtual machine.

Virtual Machine Hardware

When running, a virtual machine behaves as though it is a computer with the following hardware components:

- Intel Pentium processor.
- A generic motherboard compatible with the Intel i815 chipset.
- Up to 1500 MB of memory.
- VGA or SVGA display with VESA 3.0 support.
- A 1.44 MB floppy drive mapped to an image file.
- Up to four IDE devices. Each device may be either a virtual hard drive from 20 MB to 128 GB mapped to an image file, a Boot Camp partition or a CD/DVD-ROM drive mapped to a physical drive or to an image file.
- Up to 5 network virtual interfaces, including Ethernet virtual network card compatible with RTL8029. By default, the virtual machine shares whatever network connection your Macintosh computer uses.
- Up to four serial (COM) ports mapped to a socket or to an output file.
- Up to three parallel (LPT) ports mapped to an output file or to a printer connected to the Macintosh computer.
- 8-port USB 2.0 controller and a 2-port USB 1.1 controller.
- AC'97-compatible sound card. Sound recording is supported.
- A generic PC keyboard.
- A PS/2 wheel mouse.

Installing Parallels Desktop

If you purchased a boxed copy of Parallels Desktop, insert the Parallels Desktop CD into your computer's CD/DVD-ROM drive. In the Finder, open the Parallels Desktop CD, and open the Parallels Desktop package.

If you purchased Parallels Desktop from the Parallels Online Store, please download the latest build at Parallels Download Center <http://www.parallels.com/en/download/>. When the download is complete, double-click the downloaded DMG file to open the Parallels Desktop Installer window. To start the installation, double-click **Install Parallels Desktop**.

- 1 The Welcome dialog appears. Click the Continue button.

- 2 In the Software License Agreement dialog use the scroll bar to read the License Agreement up to the end. Click **Print** to print the agreement for your records, or click **Save** to save it for future reading. When you are finished reading the agreement, click **Continue**.

Note. At almost any time during this installation, you can return to the previous step by clicking **Go Back**.

- 3 The following dialog will appear. Click Agree.

- 4 In the Select a Destination dialog select the hard disk on which to install Parallels Desktop.

Note. Parallels Desktop can be installed on the *boot volume* only, the same volume on which Mac OS X is installed. Other disks, partitions or external drives are unavailable for selection.

Click Continue.

- 5 The Easy Install on "Macintosh HD" window appears. Click **Install** to start the Parallels Desktop installation.

- 6 The Installing Parallels Desktop window displays the installation's progress..
7 When the Installer informs you that the installation was successful, click **Close**.

CHAPTER 3

Launching Parallels Desktop

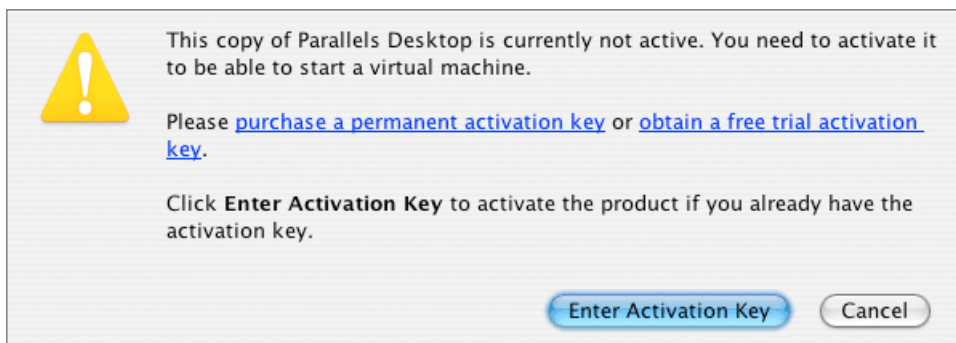

By default, Parallels Desktop is installed in the following folder: `/Applications/Parallels/`.

When the installation is complete, the Finder opens the `Parallels` folder automatically. To launch Parallels Desktop, double-click **Parallels Desktop**.

For easy access to Parallels Desktop, drag the Parallels Desktop icon  from the `Parallels` folder to the Dock. This will enable you to launch Parallels Desktop by clicking the Parallels Desktop icon in the Dock.

Activating Parallels Desktop

You must activate your copy of Parallels Desktop. Otherwise, you will not be able to create or use your virtual machine. When you launch Parallels Desktop for the first time, the following message appears:

To activate your copy of Parallels Desktop:

- 1 In the Activation dialog, click Enter Activation Key.
- 2 In the Activation Key window, enter the activation key. You can also specify your name and you company name in the User Name and Company Name fields. These fields are optional. Click the Activate button.

A window titled "Activation Key" with three input fields: "Activation Key:", "User Name:", and "Company Name:". Below these fields is a large text area containing the message: "This copy of Parallels Desktop is currently not active. Please [purchase a permanent activation key](#) or [obtain a free trial activation key](#)." At the bottom right, there are two buttons: "Cancel" and "Activate".

- 3 When your copy of Parallels Desktop is activated, the **Welcome to Parallels Desktop** dialog appears. Click **Register** if you wish to register your copy of Parallels Desktop and subscribe to the Parallels newsletter. Otherwise, click either **Remind me Later** or **Don't Ask Me Again**.

Creating a Virtual Machine

When your copy of Parallels Desktop is activated, you can create a virtual machine.

This chapter describes the *Windows Express* method of creating a ready-to-use virtual machine. The *Windows Express* method is available only for Windows XP and Windows Vista operating systems.

You need a complete, fully licensed copy of Windows XP or Windows Vista. You may use an installation CD or an ISO image of the installation CD.

Note. If you have a printer connected to your Macintosh computer, OS Installation Assistant will connect it via parallel port to the virtual machine.

In This Chapter

Express Installation of Windows XP or Windows Vista	13
Troubleshooting	19

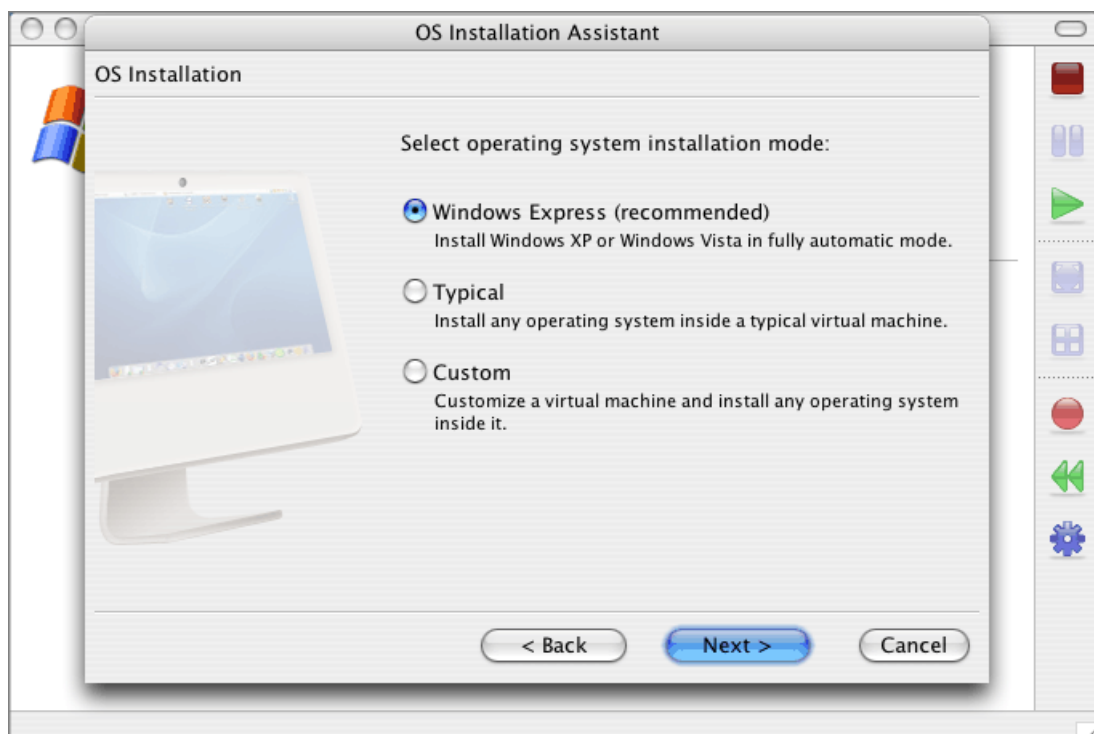

Express Installation of Windows XP or Windows Vista

- 1 Launch Parallels Desktop.
- 2 Parallels Desktop main window appears. Parallels Desktop is browsing files on your computer for existing virtual machines.
 - If Parallels Desktop cannot locate any virtual machine on your Macintosh computer, the Welcome window of OS Installation Assistant appears.
 - If Parallels Desktop locates a virtual machine on your computer, the list of virtual machines appears in the **Select virtual machine** dialog so that you can select and open any of them.

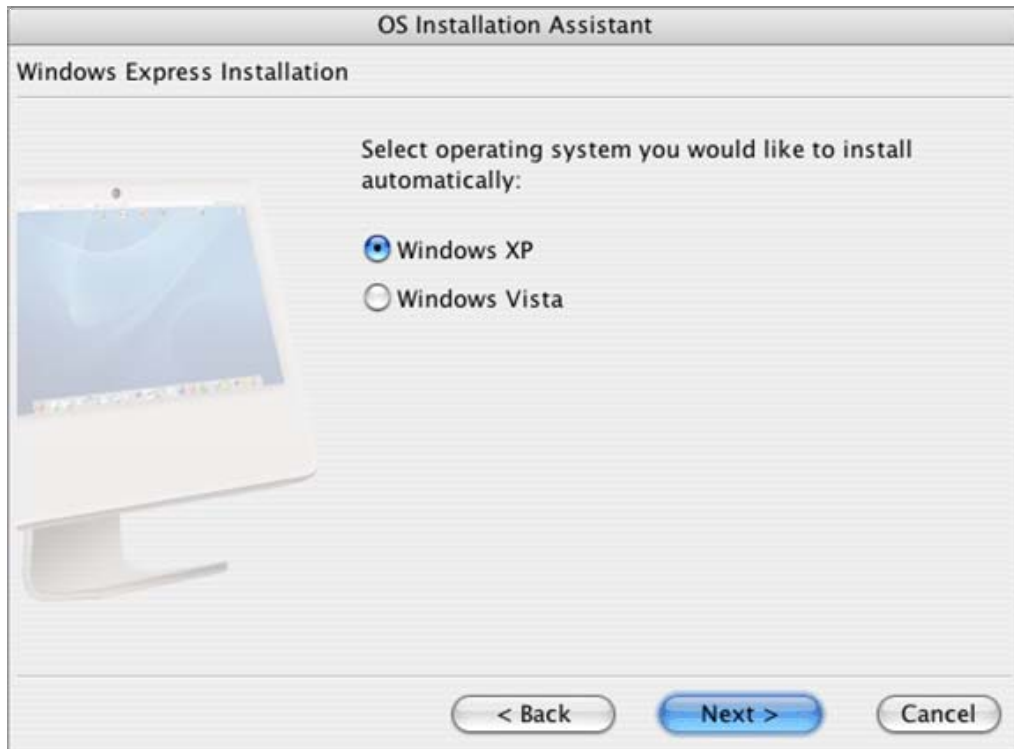

To create a new virtual machine, click the New button, or choose New from the File menu, and you will see the Welcome window of OS Installation Assistant.

- 3 In the Welcome window, select the Windows Express option and click Next.

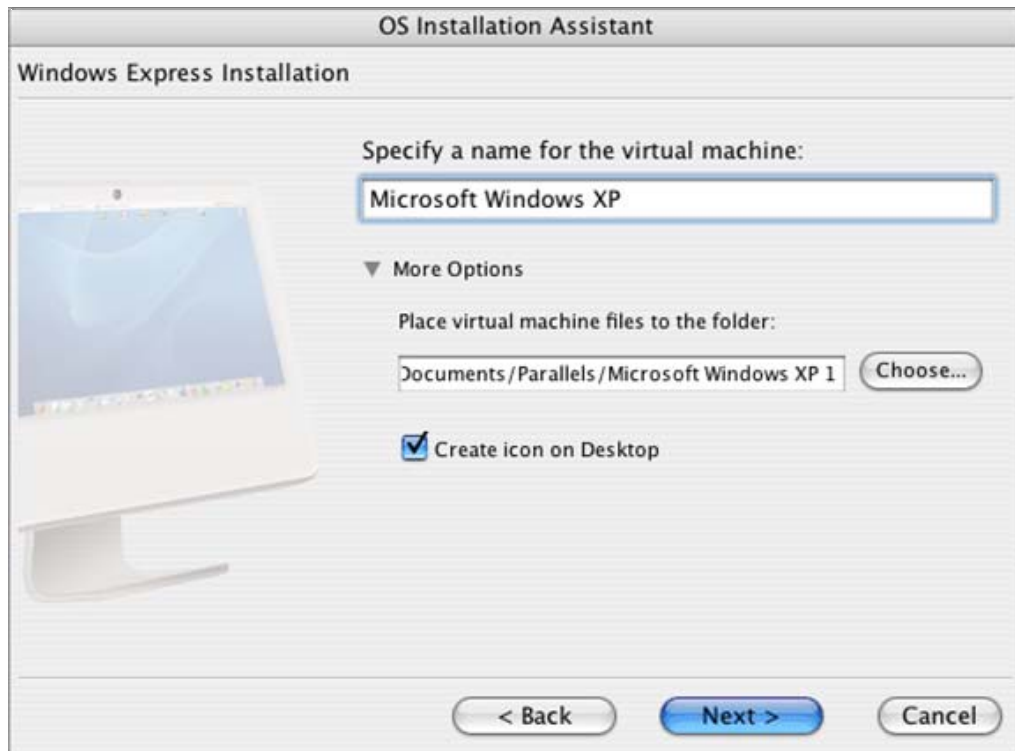

- 4 Select the Windows operating system to be installed and click Next.

- 5 Enter the Product Key for your copy of Windows and your Name. You can also enter the name of your Organization. Click Next.

- 6 Specify a name for the virtual machine as you want it to appear in the list of available virtual machines on the **Select virtual machine** dialog. By default, the virtual machine is named by the guest operating system. Click **More Options**, if you want to choose other than the default location for the virtual machine.

- 7 Choose the preferable way of allocating the computer resources: to the virtual machine or to Mac OS X.

- 8 If you want to use an installation CD, insert the disc into the CD/DVD-ROM drive of your computer.

If you want to use an ISO image of the installation disc:

- Click **More Options** and select the ISO image option.
- The **Choose** button becomes enabled. Click it to locate the ISO image file.

Make sure that the **Start Windows XP Installation** check box is selected and click **Finish**.

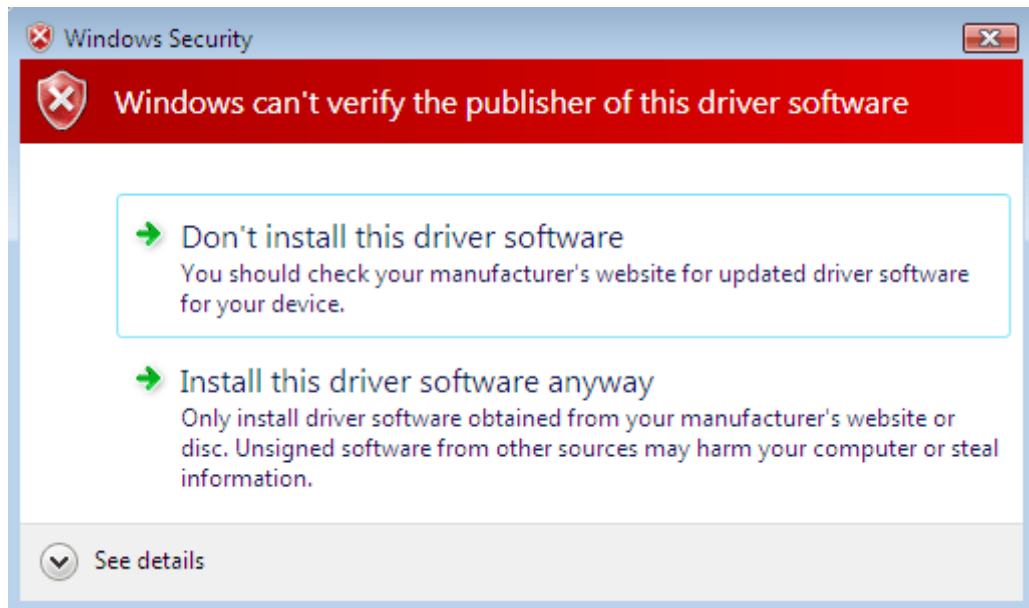

- 9 The **OS Installation Assistant** creates the virtual machine and installs Windows XP or Windows Vista operating system in it. This process takes approximately one hour.

Note. During the guest OS installation, the input of keyboard and mouse is captured inside the virtual machine. To release the keyboard and mouse input for Mac OS X press **Control+Alt** or **Control+Option(Alt)**. To capture the input again in the virtual machine, click inside the virtual machine window (guest OS window).

- 10 After installing the Windows operating system, **OS Installation Assistant** installs **Parallels Tools** in the newly created virtual machine. You need to confirm **Parallels Tools** installation, when prompted.

During Parallels Tools installation you need to confirm the installation of so-called unsigned drivers. Always choose **Install this driver software anyway**.

- 11 When the installation is complete, either eject the installation disc or disconnect the ISO image of the installation disc. See below for details.
- 12 To protect your new virtual machine, from the **Actions** menu choose **Install Kaspersky Internet Security**. This feature is available for both Windows XP and Windows Vista.
- 13 During the *Express Installation*, Parallels Desktop creates an administrator account with a blank password. To learn how to change the administrator password, open the **Help** menu and choose **Parallels Desktop Help -> Creating a Virtual Machine -> OS Installation Assistant -> Windows Express Installation**.

Ejecting CD/DVD Disc

- Press the **Eject** key on your keyboard (a triangle with a line underneath). If you are using a keyboard that does not have an **Eject** key, drag the CD/DVD disc icon to the Trash to eject the disc.
- In Windows, open the **My Computer** folder, right-click (**Control-click**) the CD/DVD disc icon, and choose **Eject** from the shortcut menu.

Disconnecting ISO Image

Right-click the CD/DVD-ROM icon  located at the bottom of the Parallels Desktop window, and select **Disconnect** in the menu.

Troubleshooting

A. It may happen that your Macintosh computer cannot read the Windows XP or Windows Vista installation disc: the installation doesn't start or it goes too slow and is accompanied by errors. In this case, try to use an ISO image of the installation disc. To create an ISO image, use Disk Utility or a third-party imaging application installed on any other computer. Disk Utility can be found: `/Application/Utilities Disk Utility`.

B. There may be problems with localized versions of Windows used for unattended installation in a virtual machine. If your Mac OS X is set to English, but you decide to install a localized version of Windows in the virtual machine, there may problems with displaying the Windows start menu options or the All Programs list correctly.

To work around this problem set the Mac OS X regional settings to the same language the Windows is localized to. When the installation of the guest OS is complete, you can return the language and regional settings back to the original values.

Running the Virtual Machine

This chapter provides basic information on options available when you run the virtual machine.

In This Chapter

Toolbar	20
Stopping and Pausing the Virtual Machine	22
Starting and Resuming Virtual Machine	23
Switching View Modes	24
Networking in the Virtual Machine	25
Setting up Shared Folders in the Virtual Machine	25
Installing Windows Applications	26

Toolbar

To start, stop, and pause your virtual machine you can use the toolbar buttons or the **Actions** menu commands.

By default, the toolbar is located to the right of Parallels Desktop Window.

The toolbar has three groups of buttons:

-  ,  ,  - for stopping, pausing and starting the virtual machine.
-  ,  - for switching view modes of the virtual machine.
-  ,  ,  - for saving and managing virtual machine states (the snapshots). For more information on snapshots, open **Help** menu and choose **Parallels Desktop Help -> Managing Virtual Machines -> Working With Snapshots and Undo Disks**.

Toolbar position

If the toolbar is hidden, to display it:

- Click the toolbar control button in the upper right corner of Parallels Desktop window.
- Choose **Customize** from the **View** menu. Click the **Main Window** tab, select the **Show toolbar** option and click **OK**.

The toolbar can be positioned to the right, to the left, or at the top of the Parallels Desktop window. To change the toolbar position:

- 1 Choose **Customize** from the **View** menu.
- 2 On the **Main Window** tab select the appropriate option in the **Toolbar placement** list and click **OK**.

Stopping and Pausing the Virtual Machine

To stop your virtual machine, select **Shut Down** or **Turn Off Computer** from the Windows **Start** menu.

Warning. It is strongly recommended that you shut down your virtual machine in this manner to ensure the safety of your data.

Use the following only if you are unable to shut down your virtual machine from the Windows **Start** menu:

- Click the **Stop Virtual Machine**  button on the toolbar.
- Choose **Stop** from the **Actions** menu.

Pausing the Virtual Machine

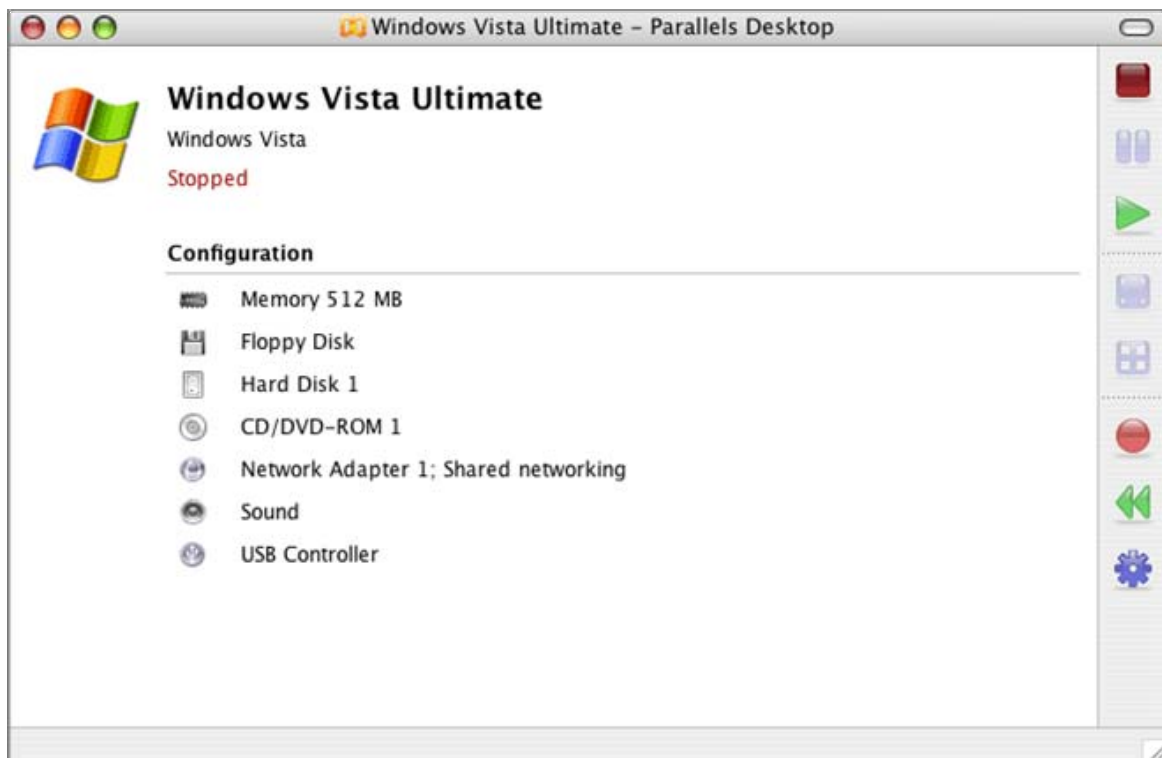

In some cases, you may need to pause the virtual machine, for example, if you need to run a CPU-consuming process on your Mac.

- Click the **Pause Virtual Machine** button  on the toolbar.
- Choose **Pause** from the **Actions** menu.

Starting and Resuming Virtual Machine

When you launch Parallels Desktop, it displays the **Select virtual machine** dialog. Select the virtual machine in the list and click the **Select** button.

The **Configuration Page** of the selected virtual machine appears.

Configuration Page displays the list of virtual machine's hardware and options. Each item listed is a link to the Configuration Editor, which can be used to add or remove hardware and to view and configure device options.

To start or resume the virtual machine:

- Click the **Start Virtual Machine**  button on the toolbar.
- Choose **Start Virtual Machine** from the **Actions** menu.

Switching View Modes

When the virtual machine is stopped you can only view its Configuration Page in Parallels Desktop window.

When you start the virtual machine, the Parallels Desktop window transforms into the guest OS Window and displays the booting process of the guest OS.

When the virtual machine is running, Parallels Desktop allows you to switch between the following view modes.

- Full Screen
- OS Window
- Coherence (only for Windows guest operating systems)
- Configuration Page. All links are disabled at runtime.

For switching between the view modes, use the toolbar buttons or the **View** menu commands.

By default, the virtual machine starts in OS Window mode, which displays Windows in a separate window on the Mac OS X desktop. Use the toolbar buttons or the **View** menu commands to switch between the viewing modes.

Switching to Full Screen Mode

In full screen mode, the guest OS Window expands to occupy the entire screen, so that Mac OS X controls and the Dock are not visible.

To switch the guest OS Window to full screen mode:

- Click the **Full Screen**  button on the toolbar.
- Choose **Full Screen** from the **View** menu.
- Press `Option(Alt) + Return(Enter)`.

To view the Parallels Desktop menus and the Mac OS X Dock while in full screen mode, press `Control+Option(Alt)`.

To return to the OS Window mode, choose **OS Window** from the **View** menu or press `Option(Alt) + Return(Enter)`.

To select the type of animation for switching to Full Screen mode, choose **Preferences** from the **Parallels Desktop** menu on the menu bar. Click the **Animation** tab, and in the **Full Screen transition** list select the type of animation you prefer. Click **OK**. For more information, open the **Help** menu and choose **Parallels Desktop Help -> Managing Virtual Machines -> Setting Parallels Desktop Preferences -> Animation Tab**.

Switching to Coherence Mode

In Coherence mode, you will view the Windows applications directly on your Mac's desktop instead of inside the virtual machine's window.

To switch the virtual machine to Coherence mode

- Click the Coherence  button on the toolbar.
- Choose Coherence from the View menu.
- Press `Shift+Control+Option(Alt)`.

To return to the OS Window mode, choose OS Window from the View menu or press `Shift+Control+Option(Alt)`.

To animate switching to Coherence mode and back:

- 1 From the Parallels Desktop menu choose Preferences.
- 2 Click the Animation tab.
- 3 Select the Animate Coherence transition option.

Networking in the Virtual Machine

If your Macintosh computer is connected to the Internet, so will your virtual machine. By default, the virtual machine shares the network connection your Mac uses. In addition to the default *Shared Networking (NAT)* option, the following networking options are also available for the virtual machine:

- Bridged Ethernet.
- Host-only networking

For more information on networking in virtual machines, open the Help menu and choose Parallels Desktop Help -> Configuring Virtual Machine --> Networking in a Virtual Machine.

Setting up Shared Folders in the Virtual Machine

For files exchange between Mac OS X and your Windows virtual machine, you can set up one or more shared folders that will be visible in both operating systems. For more information, open the Help menu and choose Parallels Desktop Help -> Configuring Virtual Machine -> Using Shared Folders.

Installing Windows Applications

You can install your favorite Windows applications inside your running virtual machine, using the following media:

- CD and DVD discs.
- ISO images of CD or DVD discs made with the help of third-party imaging products.
- Installation files placed into shared folders.
- Local network resources or the Internet resources.

To use installation CD/DVD discs

- 1** Insert the disc.
- 2** Do one of the following:
 - Click the CD-ROM icon on the status bar, and choose **Default CD/DVD-ROM** from the shortcut menu.
 - Choose **CD/DVD-ROM1 > Default CD/DVD-ROM** from the **Devices** menu.

To use ISO images

- 1** Do one of the following:
 - Click the CD-ROM icon on the status bar, and choose **Connect image** from the shortcut menu.
 - Choose **CD/DVD-ROM1 > Connect image** from the **Devices** menu.
- 2** Specify the image file.

Please refer to the application documentation for further installation steps.

Viewing or Editing the Virtual Machine Configuration

The virtual machine configuration is a list of the virtual machine's hardware and options. This list is displayed on Configuration Page and is available for editing in Configuration Editor.

To view the configuration of the running virtual machine, choose **VM Configuration** from the **View** menu. The guest OS window flips to Configuration Page where you can view the virtual machine's list of hardware and options. Because you cannot edit a running virtual machine, all of the links to the virtual machine's hardware and options are disabled.

Viewing the Configuration

To view the configuration of a running virtual machine choose **VM Configuration** from the **View** menu. The guest OS window flips to Configuration Page. You can see the list of virtual hardware and virtual machine options in the Configuration area, but all links are disabled. When the virtual machine is running, you can only view its configuration. You cannot edit it.

Note. Configuration Editor is available only when the virtual machine is stopped. The configuration of a suspended virtual machine is unavailable for editing.

Editing Configuration

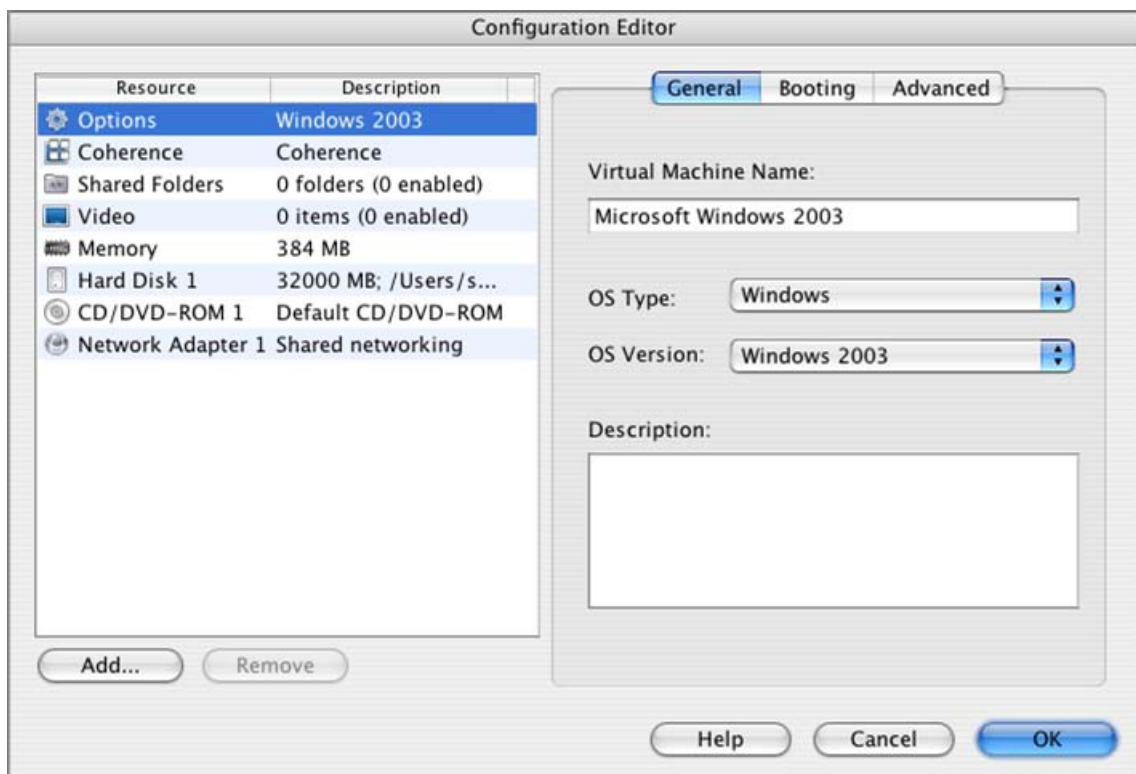

Launch Parallels Desktop by clicking its icon  in the Dock or its alias on the Mac OS X desktop. Choose the virtual machine from the **Select virtual machine** dialog and click **Select**. The Configuration Page of the virtual machine appears, and you can see the list of virtual hardware in the Configuration area.

To edit the virtual machine configuration:

- Click the **Configuration** link or any device link in the list.
- Choose **Virtual Machine** from the **Edit** menu.

Configuration Editor appears.

The Configuration Editor window consists of two panes. The left pane contains the **Resource** list. Selecting the device in the list opens the device options tab in the right pane.

To add hardware or options, click **Add**. To remove hardware or options, click **Remove**. For more information, open the **Help** menu and choose **Parallels Desktop Help -> Configuring Virtual Machine -> Adding and Removing Devices**.

Troubleshooting

If your virtual machine starts up immediately when you click its alias on the Mac OS X desktop, to open Configuration Page do one of the following:

- While pressing the Command key, double-click the virtual machine's alias.
- Start Parallels Desktop. In the **Select virtual machine** dialog, highlight the desired virtual machine and, while pressing the Command key, click the **Select** button.

Usage Tips

Locating the Virtual Machine Folder

To view the complete path to your virtual machine folder, while pressing the Command key, click the Parallels icon  on the title bar of the Guest OS Window.

Creating an alias for a specific virtual machine

Press **Command+Option (Alt)** while you drag the Parallels Desktop icon  from the title bar to the desktop or to the Dock. Clicking this alias will start the virtual machine automatically.

Adding your Windows application icon to the Dock

When you launch an application in the virtual machine with Windows installed, the application's icon appears in the Dock by default. Right-click (**Control-click**) the application's icon in the Dock, and select **Keep in Dock**. Even when the virtual machine is stopped, the application icon will remain in the Dock.

Clicking the application's icon in the Dock launches the virtual machine and the Windows application in it.

Creating an alias for your favorite Windows application

Launch an application in Windows. Right-click (**Control-click**) the application's icon in the Dock, and select **Add to Favorites** from the shortcut menu. The application's name appears in the **Favorites** section of the **Applications** menu, and an alias for the application is created on Mac OS X desktop. Double-clicking this alias launches the virtual machine and your favorite application.

To remove the application from your **Favorites**, right-click the application's icon in the Dock, and select **Remove from Favorites**.

Using the Application Switcher

When you run the virtual machine in Coherence mode, use the Application Switcher to switch between Mac OS X and Windows running applications. While pressing the **Command** key, press **Tab** one or more times to select the application on the Applications Switcher bar. The selected application becomes active.

SmartSelect

In the virtual machine you can open Mac OS X applications. The list of Parallels Shared Applications is created during the installation of Parallels Tools. The list includes your Mac OS X applications and is available when you choose **All Programs -> Parallels Shared Applications** from the Windows **Start** menu. You can select any application from the list and start it.

Right-click your document in Mac OS X or Windows and choose any available Mac OS X or Windows application from the **Open With** list.

You can also choose the default application for opening files of a certain type both in Mac OS X and in Windows. When you start any Windows application for the first time you will be prompted to decide if you want to set this application as a default application for opening files (with supported extensions) in Mac OS X.

Migrating Your Real or Virtual Computer into Parallels Virtual Machine

Use Parallels Transporter to migrate from a PC with a Windows operating system installed to a Parallels virtual machine. In this version, third-party virtual computers can be migrated into Parallels virtual machines with the same configuration. Parallels Transporter is installed along with Parallels Desktop. For more information about Parallels Transporter, refer to *Parallels Transporter User Guide*.

Exploring the Virtual Machines

Parallels Explorer allows you to view the contents of any Parallels or third-party virtual machine even when it is stopped. Open the virtual machine in Parallels Explorer and see what is inside it. Drag files from one virtual machine to another or copy files to Mac OS X. Parallels Explorer is installed along with Parallels Desktop. For details, see *Parallels Explorer User Guide* or open the **Help** menu and choose **Parallels Desktop Help -> Managing Virtual Machines -> Using Parallels Explorer**.
